

PARAPHRASE, SUMMARIZE, QUOTE
SCIENCE BOOK EXCERPT PRACTICE

Heat makes molecules of water move faster and separate from one another. They move into the air. When this happens we say the water evaporates. Then we call it water vapor. Water evaporates from oceans, rivers, and lakes. It also comes from the ground and from plants. All air has some water vapor in it.

Webster, Vera. *Weather Experiments*. Children's Press, 1982.
